Lab 22 — DPO/ORPO Alignment (T4 tier)

Track 3 · Day 22 · VinUni AICB program

This is a single-file Colab notebook stitching all 6 stages of the lab:

1. SFT-mini build (replaces Lab 21)
2. Preference data prep
3. DPO training (the main event)
4. Side-by-side comparison + eval
5. Merge → GGUF → llama.cpp smoke test
6. LLM benchmark (IFEval / GSM8K / MMLU / AlpacaEval-lite)

Tier: `T4` — Qwen2.5-3B + 2k UltraFeedback

> **Before running:** Runtime → Change runtime type → T4 GPU (free). Verify with `nvidia-smi` cell below.

> **Reference:** `README.md`, `HARDWARE-GUIDE.md`, and the deck source `day22/day07-dpo-orpo-alignment-tu-sft-en-preference-learning.tex`.

A. Colab setup — install deps + set tier

(Skip these cells if running in Jupyter from the lab repo.)

Stages 1-5 stitched below

Each stage has its own header. Run cells in order. If you OOM, restart runtime and reduce model size or batch (see `HARDWARE-GUIDE.md`).

▸ Stage from `notebooks/01_sft_mini.py`

NB1 — SFT-mini: Build the Lab 21 SFT checkpoint inline

Stack: Unsloth + LoRA r=16 + bitsandbytes 4-bit base + 1k VN Alpaca, 1 epoch. Maps to deck §1 (why SFT alone insufficient — motivates the upcoming DPO step) + deck §3 (DPO will need this SFT checkpoint as initial policy).

> **Mục tiêu:** tạo 1 SFT adapter "đủ tốt" để DPO có gì align lên. Đây là Lab 21 thu gọn — nếu bạn đã hoàn thành Lab 21 sibling repo (VinUni-AI20k/Day21-Track3-Finetuning-LLMs-LoRA-QLoRA), bạn có thể SKIP notebook này và copy adapter cũ vào `adapters/sft-mini/`.
>
> Nếu chưa, notebook này build từ đầu trong ~10 phút trên T4 (15 phút trên Colab CPU runtime — *đừng làm vậy*).

0. Setup

1. Load base model with Unsloth

Unsloth bundles patched 4-bit kernels — that's how Qwen2.5-3B (or 7B) stays in T4 / A100 budget. The `FastLanguageModel.from_pretrained` call returns a 4-bit quantized base; `get_peft_model` attaches the LoRA adapter on top.

```
from unsloth import FastLanguageModel

model, tokenizer = FastLanguageModel.from_pretrained(
    model_name=BASE_MODEL,
    max_seq_length=MAX_LEN,
    dtype=None,                # auto: bf16 on Ampere+, fp16 on Turing
    load_in_4bit=True,
)

# Critical for batch training — Qwen tokenizers ship without pad token.
if tokenizer.pad_token is None:
    tokenizer.pad_token = tokenizer.eos_token
    print("Set tokenizer.pad_token = eos_token")
```

```
🦥 Unsloth: Will patch your computer to enable 2x faster free finetuning.
🦥 Unsloth Zoo will now patch everything to make training faster!
==((====))==  Unsloth 2026.5.2: Fast Qwen2 patching. Transformers: 5.5.0.

```

5. Vibe-coding callout

Bạn vừa tái tạo Lab 21 trong ~10 phút. Một câu hỏi để brainstorm:

> **Thật ra, bạn cần *bao nhiêu* SFT để DPO có ý nghĩa?**
>
> Thử thay `SFT_SLICE = 1000` → `100`. Re-run NB1 → NB3 với SFT yếu hơn. Quan sát: reward gap có còn tăng được không? Output coherent không?
>
> Đây là 1 design decision *think-hard zone* (xem VIBE-CODING.md): không có đáp án sẵn trong deck. Hypothesize trước, train sau, viết kết quả vào `submission/REFLECTION.md` § 6.

Next: NB2 — load + format preference data.

▸ Stage from `notebooks/02_preference_data.py`

NB2 — Preference Data

Stack: `argilla/ultrafeedback-binarized-preferences-cleaned` + tokenizer apply_chat_template. Maps to deck §5.1 (preference data formats) + §5.4 (VN landscape — what exists vs not).

> **Mục tiêu:** load preference dataset, format thành `{prompt, chosen, rejected}` với chat template Qwen2.5, lưu Parquet vào `data/pref/`. Không train gì cả — đây là pure data prep.
>
> Deck §5.4 lists VN preference data realities:
>
> - **VinaLLaMA / PhoGPT / Vistral**: SFT-only, no published DPO data.
> - **SeaLLM / Sailor2**: DPO-aligned, Sailor2 has `Sailor2-translated-ultrafeedback-vi`.
> - **Native VN preference**: gap. **Bonus B** (xem `BONUS-CHALLENGE.md`) là cơ hội build.

0. Setup

```
import os
from pathlib import Path

COMPUTE_TIER = os.environ.get("COMPUTE_TIER", "T4").upper()

if COMPUTE_TIER == "T4":
    PREF_SLICE = 400 # Reduced for faster execution
    MAX_LEN = 512
    MAX_PROMPT_LEN = 256
else:
    PREF_SLICE = 5000
    MAX_LEN = 1024
```

```
    MAX_PROMPT_LEN = 512

PREF_DATASET = os.environ.get(
    "PREF_DATASET", "argilla/ultrafeedback-binarized-preferences-cleaned"
)

REPO_ROOT = Path.cwd().parent if Path.cwd().name == "notebooks" else Path.cwd()
ADAPTER_DIR = REPO_ROOT / "adapters" / "sft-mini"
PREF_OUT = REPO_ROOT / "data" / "pref"
PREF_OUT.mkdir(parents=True, exist_ok=True)

print(f"COMPUTE_TIER:    {COMPUTE_TIER}")
print(f"PREF_DATASET:    {PREF_DATASET}  (slice: {PREF_SLICE})")
print(f"MAX_LEN:         {MAX_LEN}")
print(f"MAX_PROMPT_LEN:  {MAX_PROMPT_LEN}")
print(f"output:          {PREF_OUT}")
```

```

PREF_DATASET:    argilla/ultrafeedback-binarized-preferences-cleaned  (slice: 400)
MAX_LEN:         512
MAX_PROMPT_LEN:  256
output:          /content/lab22/data/pref
```

1. Load tokenizer (matches NB1 base model)

```
from transformers import AutoTokenizer

assert ADAPTER_DIR.exists(), f"NB1 must run first — {ADAPTER_DIR} missing"
tokenizer = AutoTokenizer.from_pretrained(ADAPTER_DIR)
if tokenizer.pad_token is None:
    tokenizer.pad_token = tokenizer.eos_token
print(f"Tokenizer: {tokenizer.__class__.__name__}  vocab={tokenizer.vocab_size:,}")
```

```
Tokenizer: Qwen2Tokenizer  vocab=151,643
```

2. Load UltraFeedback (English baseline)

Why English? UltraFeedback was the canonical preference dataset of the deck demo (§7.1: "2k UltraFeedback pairs, 30 min A100, 3.2 → 4.1 helpfulness"). Using the same dataset = numbers comparable to deck.

Why not Vietnamese? Native VN preference data is a gap (deck §5.4). Translated data (`Sailor2-translated-ultrafeedback-vi`) exists but is NLLB-MT-quality, not native. Bonus B has the full provocation.

```
from datasets import load_dataset

ds = load_dataset(PREF_DATASET, split=f"train[:{PREF_SLICE}]")
print(f"Loaded {len(ds)} pairs. Columns: {ds.column_names}")
```

```
README.md:        4.46k/?  [00:00<00:00,  337kB/s]
data/train-00000-of-                                                    143M/143M  [00:01<00:00,  351MB/s]
00001.parquet:  100%

Loaded 400 pairs. Columns: ['source', 'prompt', 'chosen', 'chosen_rating', 'chosen_model', 'project
```

3. Format with chat template

DPO Trainer expects `prompt / chosen / rejected` columns. Each must already include the chat template tokens — Trainer doesn't apply template internally.

```
def format_pref(row):
    prompt_msgs = [{"role": "user", "content": row["prompt"]}]

    # Define the ChatML template for Qwen2.5
    qwen_chat_template = "{% for message in messages %}{% if message['role'] == 'system' %}{{ '<|:

    prompt_text = tokenizer.apply_chat_template(
        prompt_msgs, tokenize=False, add_generation_prompt=True,
        chat_template=qwen_chat_template # Explicitly pass the template
    )
    # `chosen` and `rejected` in this dataset are list-of-dicts with role/content.
    # Take just the assistant turn text (last message).
    chosen_text = row["chosen"][-1]["content"] if isinstance(row["chosen"], list) else row["chose
    rejected_text = row["rejected"][-1]["content"] if isinstance(row["rejected"], list) else row['
    return {
        "prompt": prompt_text,
        "chosen": chosen_text,
        "rejected": rejected_text,
    }

pref = ds.map(format_pref, remove_columns=ds.column_names)
print(f"Formatted: {len(pref)} pairs \u00b7 cols: {pref.column_names}")
```

```
Map: 100%                                          400/400 [00:00<00:00, 4408.59 examples/s]
Formatted: 400 pairs · cols: ['prompt', 'chosen', 'rejected']
```

3a. Inspect 3 examples + token counts (deliverable: NB2 rubric §2)

```
import textwrap

```

3b. Length distribution check

Pairs longer than `MAX_LEN` will be truncated by the trainer. If too many are clipped, DPO loses signal. Aim for ≥ 80% of pairs fitting.

```
import numpy as np

prompt_lens = np.array([len(tokenizer(p).input_ids) for p in pref["prompt"]])
chosen_lens = np.array([len(tokenizer(c).input_ids) for c in pref["chosen"]])
rejected_lens = np.array([len(tokenizer(r).input_ids) for r in pref["rejected"]])

total_len = prompt_lens + np.maximum(chosen_lens, rejected_lens)
fit_pct = (total_len <= MAX_LEN).mean() * 100

print(f"Prompt:   median={np.median(prompt_lens):.0f}  P95={np.percentile(prompt_lens, 95):.0f}")
print(f"Chosen:   median={np.median(chosen_lens):.0f}  P95={np.percentile(chosen_lens, 95):.0f}")
print(f"Rejected: median={np.median(rejected_lens):.0f}  P95={np.percentile(rejected_lens, 95):.0
print(f"\n{fit_pct:.1f}% of pairs fit in MAX_LEN={MAX_LEN}")
if fit_pct < 80:
    print("⚠  Less than 80% fit. Consider increasing MAX_LEN or filtering long pairs.")
```

```
Prompt:   median=84  P95=305
Chosen:   median=420  P95=812
Rejected: median=296  P95=780

42.8% of pairs fit in MAX_LEN=512
⚠  Less than 80% fit. Consider increasing MAX_LEN or filtering long pairs.
```

4. Save Parquet

```
pref.to_parquet(str(PREF_OUT / "train.parquet"))
print(f"Saved {len(pref)} pairs to {PREF_OUT / 'train.parquet'}")

# Also save a small eval slice (last 50 pairs) for NB4 use.
eval_slice = pref.select(range(len(pref) - 50, len(pref)))
eval_slice.to_parquet(str(PREF_OUT / "eval.parquet"))
print(f"Saved 50 eval pairs to {PREF_OUT / 'eval.parquet'}")
```

```
Creating parquet from Arrow format: 100%  1/1 [00:00<00:00, 28.20ba/s]
Saved 400 pairs to /content/lab22/data/pref/train.parquet
Creating parquet from Arrow format: 100%  1/1 [00:00<00:00, 58.10ba/s]
Saved 50 eval pairs to /content/lab22/data/pref/eval.parquet
```

5. Vibe-coding callout

Bạn vừa load 2k cặp English UltraFeedback. Cho VN-aligned model thực sự bạn cần preference data tiếng Việt. Có 3 con đường (deck §5.3 — `BONUS-CHALLENGE.md` provocation #1 nếu muốn full):

1. **Translate**: chạy NLLB-3.3B trên 2k cặp này. Quality OK, không native.

2. **Generate native**: 200 prompts VN từ VMLU stems → 2 responses (Lab21-SFT vs stronger model như Gemini Flash) → judge với GPT-4o → train DPO trên đó.
3. **Hybrid**: 1.8k UltraFeedback + 200 native VN. Best-of-both.

Notebook 03 dùng English baseline (option 0) cho fairness với deck demo. Nếu bạn ambitious: thay `data/pref/train.parquet` ở NB3 bằng dataset của bạn — code sau đó không đổi.

Next: NB3 — train DPO trainer với reward curves.

▸ Stage from `notebooks/03_dpo_train.py`

NB3 — DPO Training (the main event)

Stack: TRL `DPOTrainer` + `DPOConfig(beta=0.1, lr=5e-7)` from deck §5.2. Maps to deck §3 (DPO derivation), §3.4 (failure modes — read closely!), §5.2 (TRL impl).

> **Mục tiêu:** train DPO adapter on top of NB1 SFT-mini. Plot reward curves (cả `chosen_rewards` và `rejected_rewards`). Save adapter to `adapters/dpo/`.
>
> Đây là **the** notebook quan trọng nhất của lab — 25/100 pts đến từ đây. Đặc biệt là: **plot cả 2 curve riêng biệt**, không chỉ reward gap (deck §3.4).

0. Setup

```
import os
from pathlib import Path

COMPUTE_TIER = os.environ.get("COMPUTE_TIER", "T4").upper()

if COMPUTE_TIER == "T4":

```

1. Load policy + reference (the VRAM-doubling part)

Critical: DPO needs the policy (trainable) AND a frozen reference (no grad). The reference is the SFT model at step 0; we load it twice. Unsloth's 4-bit base is shared across copies — only the LoRA adapter differs.

```
from unsloth import FastLanguageModel
from peft import PeftModel

# Policy — gets new DPO LoRA adapter on top of SFT LoRA
model, tokenizer = FastLanguageModel.from_pretrained(
    model_name=BASE_MODEL,
    max_seq_length=MAX_LEN,
    dtype=None,
    load_in_4bit=True,
)
if tokenizer.pad_token is None:
    tokenizer.pad_token = tokenizer.eos_token

# Load SFT adapter on top of base
model = PeftModel.from_pretrained(model, str(SFT_PATH), is_trainable=True)
print(f"Policy: {model.__class__.__name__} with SFT adapter loaded")
```

```

```
Final DPO loss: 0.7664
```

5. Plot reward curves — THE diagnostic

Read deck §3.4 before interpreting these. A growing reward gap can come from:

- **(intended)** chosen reward going up + rejected staying flat
- **(intended)** chosen rising slowly + rejected falling fast
- **(likelihood displacement)** chosen reward going *down* + rejected falling faster

The third case is what Razin et al. 2024 documented. It's not a bug, but it tells you the model is finding a way to widen the gap that doesn't necessarily improve actual chosen probability.

```
import matplotlib.pyplot as plt
import pandas as pd

logs = pd.DataFrame(trainer.state.log_history)
logs = logs[logs["loss"].notna() if "loss" in logs.columns else logs.index].copy()

# TRL DPO logs include rewards/chosen, rewards/rejected, rewards/margins, kl
chosen_col = "rewards/chosen" if "rewards/chosen" in logs.columns else None
rejected_col = "rewards/rejected" if "rewards/rejected" in logs.columns else None
```

```
fig, axes = plt.subplots(1, 2, figsize=(13, 4.2))

if chosen_col and rejected_col:
    axes[0].plot(logs["step"], logs[chosen_col], label="chosen reward", color="#2e548a", linewidth
    axes[0].plot(logs["step"], logs[rejected_col], label="rejected reward", color="#c83538", line
    axes[0].axhline(0, color="#888", linestyle=":", linewidth=0.7)
    axes[0].set_xlabel("Training step")
    axes[0].set_ylabel("Implicit reward (log π/π_ref)")
    axes[0].set_title("Chosen vs Rejected rewards")
    axes[0].legend()
    axes[0].grid(True, alpha=0.3)

    gap = logs[chosen_col] - logs[rejected_col]
    axes[1].plot(logs["step"], gap, color="#1a3355", linewidth=1.8)
    axes[1].axhline(0, color="#888", linestyle=":", linewidth=0.7)
    axes[1].set_xlabel("Training step")
    axes[1].set_ylabel("Reward gap (chosen − rejected)")
    axes[1].set_title("Reward gap (the headline number)")
    axes[1].grid(True, alpha=0.3)

5a. Failure-mode self-check

Read this cell carefully — it tells you which kind of "reward gap up" you got.

```
if chosen_col and rejected_col and len(logs) > 0:
    # Use whatever steps we have, up to 5
    n_tail = min(len(logs), 5)
    last_chosen = logs[chosen_col].iloc[-n_tail:].mean()
    last_rejected = logs[rejected_col].iloc[-n_tail:].mean()
    last_gap = last_chosen - last_rejected

    first_chosen = logs[chosen_col].iloc[:min(len(logs), 5)].mean()
    chosen_delta = last_chosen - first_chosen

    print(f"END  chosen reward:    {last_chosen:+.3f}")
    print(f"END  rejected reward:  {last_rejected:+.3f}")
    print(f"END  reward gap:       {last_gap:+.3f}")
```

```
    print()

    if last_gap < 0:
        print("✗ FAILURE: reward gap went NEGATIVE. DPO did the opposite of what you wanted.")
        print("  Likely causes: data quality (chosen/rejected swapped?), beta too high, lr too lo
    elif chosen_delta < -0.5 and last_gap > 0:
        print("⚠  LIKELIHOOD DISPLACEMENT (deck §3.4):")
        print(f"   Reward gap is positive ({last_gap:+.3f}) — good!")
        print(f"   But chosen reward FELL by {chosen_delta:+.3f} during training.")
        print("   The gap grew because rejected fell faster than chosen.")
        print("   Document this in REFLECTION § 3 — it's a teachable moment, not a bug.")
    elif chosen_delta > 0 and last_gap > 0:
        print("✓ INTENDED: chosen reward UP and gap positive. Classic DPO success.")
    else:
        print("?  AMBIGUOUS: weak chosen movement + positive gap. Try longer training or higher l
```

```
END  chosen reward:    -0.687
END  rejected reward:  -0.824
END  reward gap:       +0.137

?  AMBIGUOUS: weak chosen movement + positive gap. Try longer training or higher lr.
```

6. Save adapter

```
trainer.model.save_pretrained(str(DPO_OUT))
tokenizer.save_pretrained(str(DPO_OUT))
print(f"Saved DPO adapter to {DPO_OUT}")

# Save the headline metrics for verify.py + REFLECTION

Wrote metrics to /content/lab22/adapters/dpo/dpo_metrics.json
```

7. Vibe-coding callout

Now's the time for the **β experiment** if you want the +6 rigor add-on.

`make beta-sweep` runs this notebook 3 times with `DPO_BETA ∈ {0.05, 0.1, 0.5}` and saves to `adapters/dpo-b{0.05,0.1,0.5}/`. Plot the results yourself:

```
import json
import matplotlib.pyplot as plt
from pathlib import Path

results = []
for d in sorted((REPO_ROOT / "adapters").glob("dpo-b*")):
```

```
    m = json.loads((d / "dpo_metrics.json").read_text())
    results.append((m["beta"], m["end_reward_gap"]))
# plot β vs reward_gap
```

Think-hard zone: what's the *expected* shape of the β-vs-reward-gap curve? Hypothesize before you look at the data. (Hint: deck §3.3.)

Next: NB4 — qualitative side-by-side comparison.

Stage from `notebooks/04_compare_and_eval.py`

NB4 — Compare and Eval (SFT-only vs SFT+DPO)

Stack: Generation from both adapters + 8 fixed prompts + optional API judge. Maps to deck §7.1 (demo: 3.2 → 4.1 helpfulness on UltraFeedback).

> **Mục tiêu:** show that DPO actually changed model behavior. 8 prompts, 2 models (SFT-only vs SFT+DPO), side-by-side table. If you have an OpenAI/Anthropic key, also run automated judge. If not, fall back to manual rubric (no points lost).

0. Setup + 8 fixed prompts

```

Safety:         SFT-only: 0/4   SFT+DPO: 0/4   tie: 4/4
```

7. Vibe-coding callout

Mạnh nhất khi bạn cross-check với 2 judges (gpt-4o-mini + claude-haiku) — đó là rigor add-on +4 trong rubric. Đặt cả `OPENAI_API_KEY` và `ANTHROPIC_API_KEY`, duplicate cell §5 để chạy cả 2 judges, plot disagreement matrix.

Hỏi cuối: có prompt nào *cả 2 judges* sai không? (Hint: prompt #8 — safety crisis. Cả 2 judges có thể bias nhẹ về "thông cảm hơn" vs "đưa hotline" — bạn pick rubric nào là quyết định alignment, không phải technical.)

Next: NB5 — merge + GGUF + serve.

Stage from `notebooks/05_merge_deploy_gguf.py`

NB5 — Merge + Deploy + GGUF

Stack: Unsloth `merge_and_unload` + `save_pretrained_gguf(quantization='Q4_K_M')`

- llama-cpp-python smoke test. Maps to deck §7.1 lab brief: "merge adapter, quantize GGUF, serve với vLLM".

> **Mục tiêu:** export the SFT+DPO adapter as a deployable GGUF Q4_K_M file (~1.5 GB on 3B / ~4 GB on 7B), then smoke-test it through llama-cpp-python. Final cell shows the optional vLLM serving command (BigGPU only).

print(f"DPO adapter:     {DPO_PATH}")
print(f"merged output:   {MERGED_PATH}")
print(f"GGUF output:     {GGUF_DIR}")
```

```
COMPUTE_TIER:    T4
DPO adapter:     /content/lab22/adapters/dpo
merged output:   /content/lab22/adapters/merged-fp16
GGUF output:     /content/lab22/gguf
```

```
import torch

assert torch.cuda.is_available()
```

1. Load DPO model + merge adapter

```
from unsloth import FastLanguageModel
from peft import PeftModel

model, tokenizer = FastLanguageModel.from_pretrained(
    model_name=BASE_MODEL,
    max_seq_length=MAX_LEN,
    dtype=None,
    load_in_4bit=True,
)
if tokenizer.pad_token is None:
    tokenizer.pad_token = tokenizer.eos_token

# Stack SFT-mini → DPO adapters
SFT_PATH = REPO_ROOT / "adapters" / "sft-mini"
model = PeftModel.from_pretrained(model, str(SFT_PATH))
print(f"Loaded SFT-mini adapter from {SFT_PATH}")
```

```
==((====))==  Unsloth 2026.5.2: Fast Qwen2 patching. Transformers: 5.5.0.

Unsloth: Fast downloading is enabled - ignore downloading bars which are red colored!
Loading weights: 100%                                    434/434 [00:01<00:00, 511.12it/s]
unsloth/Qwen2.5-3B-bnb-4bit does not have a padding token! Will use pad_token = <|PAD_TOKEN|>.
Loaded SFT-mini adapter from /content/lab22/adapters/sft-mini
```

> **Note:** The DPO adapter trained in NB3 stacks on top of SFT. To get a fully aligned merged model, we apply both adapters before merging. Unsloth's `save_pretrained_merged` handles the SFT + DPO + base merge in one shot.

2. Save merged FP16 weights

`save_pretrained_merged(method="merged_16bit")` produces a HuggingFace-format directory you can either upload to HF Hub directly OR feed into the GGUF converter in step 3.

```
# # This re-loads the model with both SFT and DPO adapters merged into base weights.
# # Output is FP16 (or BF16 on Ampere+) HF-format weights ready for inference.
# model.save_pretrained_merged(
#     str(MERGED_PATH),
#     tokenizer,
#     save_method="merged_16bit",
# )
# print(f"Saved merged FP16 to {MERGED_PATH}")

# # Free GPU memory before GGUF conversion (which spawns a subprocess that needs RAM)
# import gc

# del model
# gc.collect()
# torch.cuda.empty_cache()
```

3. Quantize to GGUF Q4_K_M

Q4_K_M is the sweet spot: ~~4× compression vs FP16, minimal quality loss. Unsloth wraps llama.cpp's `quantize` binary — first run downloads + compiles llama.cpp (~~3 min) then quantizes (~30 s).

```
# Reload the merged model — Unsloth's GGUF saver expects a live model handle.
from unsloth import FastLanguageModel as FLM

model, tokenizer = FLM.from_pretrained(
    model_name=str(DPO_PATH),
    max_seq_length=MAX_LEN,
    dtype=None,
    load_in_4bit=False,    # already merged; load full precision
)
```

```

Model loaded successfully with llama-cpp!
```

4a. Smoke prompt + response (deliverable: `06-gguf-smoke.png`)

```
SMOKE_PROMPT = "Giải thích ngắn gọn (3 câu) cách thuật toán Bubble sort hoạt động."

response = llm.create_chat_completion(
    messages=[{"role": "user", "content": SMOKE_PROMPT}],
    max_tokens=200,
    temperature=0.0,
)

print(f"PROMPT:\n  {SMOKE_PROMPT}\n")
print(f"RESPONSE (Q4_K_M GGUF, llama-cpp-python):\n  {response['choices'][0]['message']['content']
print(f"\nTokens used: {response['usage']}")
```

```
PROMPT:
  Giải thích ngắn gọn (3 câu) cách thuật toán Bubble sort hoạt động.

RESPONSE (Q4_K_M GGUF, llama-cpp-python):
  Bubble sort là thuật toán sắp xếp phổ biến được sử dụng để sắp xếp một danh sách. Nó hoạt động bằ

Tokens used: {'prompt_tokens': 26, 'completion_tokens': 200, 'total_tokens': 226}
```

5. Optional — vLLM serving (BigGPU only)

vLLM provides production-grade OpenAI-compatible serving. **Requires CUDA GPU with ≥ 16 GB VRAM** and `vllm` installed (see `requirements-biggpu.txt`). On T4 tier this cell will OOM. Skip on T4.

Run in a SEPARATE terminal (NOT in the notebook — vLLM blocks until killed):

```
pip install vllm                        # once
vllm serve adapters/merged-fp16 \
  --port 8000 \
```

```
  --max-model-len 1024 \
  --gpu-memory-utilization 0.9
```

Then test:

```
curl http://localhost:8000/v1/chat/completions \
  -H "Content-Type: application/json" \
  -d '{"model": "merged-fp16", "messages": [{"role": "user", "content": "Hello"}]}'
```

Why not in the notebook? vLLM's process model doesn't play nicely with Jupyter — it expects to own the GPU + a long-running HTTP server. Run it as a sidecar process. The deck mentions vLLM as the deploy target; for actual production you'd containerize this command. For the lab, llama-cpp-python in step 4 is the graded artifact.

6. Save deployment metadata

```
import json
from pathlib import Path

deploy_meta = {
    "compute_tier": COMPUTE_TIER,
    "base_model": BASE_MODEL,
    "merged_path": str(MERGED_PATH),
    "gguf_path": str(gguf_path),
    "gguf_size_mb": round(Path(gguf_path).stat().st_size / 1e6, 1),
    "quantization": "q4_k_m",
    "smoke_prompt": SMOKE_PROMPT,
    "smoke_response": response["choices"][0]["message"]["content"],
}
(REPO_ROOT / "data" / "eval" / "deploy_meta.json").parent.mkdir(parents=True, exist_ok=True)
(REPO_ROOT / "data" / "eval" / "deploy_meta.json").write_text(
    json.dumps(deploy_meta, ensure_ascii=False, indent=2)
)
print("Saved data/eval/deploy_meta.json")
```

```
Saved data/eval/deploy_meta.json
```

7. Submission checklist

Bạn vừa hoàn thành core lab. Trước khi submit:

1. **Run** `make verify` — gatekeeper sẽ list missing artifacts.
2. **Take screenshots** vào `submission/screenshots/` (xem `submission/screenshots/README.md`).
3. **Fill** `submission/REFLECTION.md` — đặc biệt là § 3 (reward curves analysis, cross-reference deck §3.4) và § 6 (single change that mattered most).
4. **(Optional)** Pick a rigor add-on từ rubric.md (β-sweep, HF push, GGUF release, W&B link, cross-judge).
5. **(Optional)** Pick a `BONUS-CHALLENGE.md` provocation cho creative bonus.

Push public repo + paste URL vào VinUni LMS Day-22 box.

Câu hỏi cuối để brainstorm trước khi đóng laptop:

> **The deck says:** "DPO + 30 min A100 + 2k UltraFeedback → 3.2 → 4.1 helpfulness." **You measured:** . **Why might they differ?** Dataset (English vs VN), base model (Qwen2.5-3B vs deck's unspecified base), judge bias, sample size (8 prompts vs deck's full eval). Đó chính là § 6 trong REFLECTION — what 1 change would close the gap.

Stage from `notebooks/06_benchmark.py`

NB6 — LLM Benchmark: SFT-only vs SFT+DPO

Stack: `lm-eval-harness` (IFEval, GSM8K, MMLU) + hand-rolled AlpacaEval-lite (judge-based). Maps to deck §8.1–§8.5 (Đánh giá Alignment): static suites · judge-based suites · reward-model evaluators · VN landscape.

> **Mục tiêu:** chạy 4 benchmarks trên *cùng 1 base model* dưới 2 condition (SFT-only và SFT+DPO), thấy bằng số có gì tăng có gì giảm. Plot bar chart so sánh. Đây là cách *bạn* tự đo tương đương Tulu 3 stats §9.2b — không chỉ trích dẫn paper người khác.
>
> **Quan trọng đọc trước khi run:** deck §8.1 (vì sao đánh giá alignment khó). Một số benchmark có thể *giảm* sau DPO — đó là alignment tax (chat-tuning trade-off với reasoning), không phải bug. Document trong REFLECTION § 7.

5. AlpacaEval-lite — Win-rate vs reference (judge-based)

Mini AlpacaEval 2 LC. 100 prompts, generate from both adapters, judge with gpt-4o-mini or claude-haiku. Pure preference-style — closest in spirit to what DPO trained on.

Falls back to "skipped" if no API key. Set `OPENAI_API_KEY` or `ANTHROPIC_API_KEY` to enable.

```
from datasets import load_dataset

def load_alpaca_lite_prompts(n):
    """Load first n prompts from tatsu-lab/alpaca_eval."""
    try:
        ds = load_dataset("tatsu-lab/alpaca_eval", "alpaca_eval",
                          split="eval", trust_remote_code=True)
        return [{"id": i, "prompt": ds[i]["instruction"]} for i in range(min(n, len(ds)))]
    except Exception as exc:
        print(f"alpaca_eval dataset load failed ({exc}); using NB4 fallback")
        eval_path = EVAL_OUT / "prompts.json"
```

```
        if eval_path.exists():
            base = json.loads(eval_path.read_text())
            return (base * (n // len(base) + 1))[:n]
        return []

alpaca_prompts = load_alpaca_lite_prompts(LIMIT_ALPACA)
print(f"Loaded {len(alpaca_prompts)} AlpacaEval-lite prompts")
```

Saved /content/lab22/data/eval/benchmark_results.json
```

8. Vibe-coding callout — interpret your numbers

Câu hỏi để brainstorm trước khi viết REFLECTION § 7:

1. **Benchmark nào tăng nhiều nhất?** Nếu IFEval tăng nhiều, DPO đã làm đúng việc của nó (chat-tuning). Nếu AlpacaEval-lite tăng nhiều → preference signal transfer tốt.
2. **Benchmark nào *giảm*?** GSM8K hoặc MATH giảm = **alignment tax** kinh điển (deck §8.1). Đó không phải bug; đó là trade-off:
   - Capacity được dành cho format (theo lệnh) thay vì reasoning sâu
   - Chat data thường ngắn hơn math derivation → model học output ngắn hơn
3. **MMLU thay đổi ít hay nhiều?** MMLU đo *kiến thức nền*. DPO trên preference data thường KHÔNG dạy facts mới → MMLU thường flat (±2pp). Nếu giảm > 5pp → catastrophic forgetting, giảm β hoặc giảm epochs.
